Adobe® Flash® Media Server 4.5
Secure video experiences consistent across devices

Deliver adaptive streams to the widest audience. Secure your premium content with protected RTMP and HTTP streaming to Adobe Flash Player and iOS, delivered by a full-featured media origin server.

**Increase your audience**—Reach the widest possible audience by delivering content to Adobe Flash Player, Adobe AIR applications, and iOS devices. With new **HTTP Live Streaming (HLS)** to Apple iPad and other iOS devices—plus new protected HTTP Dynamic Streaming (HDS) for Flash Player supported on Google Android devices—the video experience can now be delivered smoothly and securely to more devices, with adaptive bitrate support to reach audiences without disruption.

**More protection options to secure video across platforms and devices**—Adobe Flash Access software optimized for streaming to Flash Player uses new cachable key delivery and does not require a license server or manual encryption of content. For full Digital Rights Management (DRM) business rules, easily add on full Flash Access compatibility. For Apple iPad and other iOS devices, use **encrypted HLS for iOS** with secure key exchange and device binding to protect your media.

**Simplify video publishing workflows**—Adobe Flash Media Server 4.5 streamlines media publishing workflows with new support for **On-Demand stream packaging for HTTP streaming**. Now your media can be packaged and protected on-the-fly for HTTP delivery for both iOS and Flash Player with full adaptive bitrate support and file caching.

**Take control of your streaming**—Turn your media server into a full-featured HTTP origin server with more resilient **HTTP origin services**. Add fault tolerance, manage QoS, control stream access and protection, access new features quickly, and leverage cloud services by operating your own media origin server for both HDS for Flash Player and HLS for iOS.

**Advanced manifest and playlist support**—Set-level F4M manifests for Flash Player and Variant M3u8 playlist support enable media players to easily leverage adaptive bitrate streaming, simplifying the production workflows and integration with your content management systems.

**Scalable real-time communication**—Achieve massive scale for P2P communication across multiple servers with new **P2P introduction forwarding for RTMFP**. Network Address Translation (NAT) for P2P maintains uninterrupted P2P communication when switching between networks. Higher-quality video (H.264) and audio capture inside Flash Player and AIR lets you develop applications for desktop and mobile devices such as business communication tools that leverage traditional VoIP systems.

**Optimize network efficiencies for the enterprise**—Publish into your corporate or broadcast network with higher quality using **multicast**. Flash Media Server 4.5 now supports Source-Specific Multicast (SSM) and Any-Source Multicast (ASM) plus new multicast ingest, recording, and re-transmission to add scale and resiliency. Multicast fusion with peer-assisted networking is now supported in both Flash Media Interactive Server and Flash Media Enterprise Server.

**Turnkey solution**—Use the latest streaming features out of the box, such as Protected HTTP Dynamic Streaming, multitrack audio, multicast streaming, DVR functionality, and HTTP Dynamic Streaming—with the choice of a prebuilt player, hosted player, or full Open Source Media Framework (OSMF). Enhanced tools for generating multicast addresses and creating manifest files for HTTP streaming simplify publishing workflow and are built right into the server.

Content protection—All configurations support protected RTMP streaming, access controls, and token authentication. Additional HTTP protection is available as follows.

- **NEW** Protected HTTP Dynamic Streaming for Flash Player compatible devices
  - 10 minutes
  - Not available
- **NEW** Protected HTTP Live Streaming for iOS devices
  - 10 minutes
  - Not available
- Adobe Flash Access DRM readiness
  - •
  - •
- Real-time encryption for multicast and P2P
  - •
  - •

Video streaming—All configurations support high-quality adaptive bitrate video streaming using both HTTP and RTMFP.

- Adaptive bitrate (RTMP, HDS, HLS)
  - •
  - •
- H.264 / AAC codec
  - •
  - •
- Multicast fusion
  - 30 minutes
  - •
- Application-level multicast (P2P)
  - 30 minutes
  - •
- Stream splitting and multprotocol
  - •
  - •
- Multicast ingest and recording
  - •
  - •

Communications—Flash Media Server can be configured for real-time communications with high-quality video and audio experiences across devices.

- **NEW** High-quality audio/video capture support
  - •
  - One-way broadcast only
- **NEW** P2P introduction forwarding for RTMFP
  - •
- Peer-assisted networking (P2P)
  - 50
  - •
- Robust server programming
  - •
  - •
- Video recording
  - •
